Relay expansion
Call and Answer review

Companion test review for George Seib
Session 7924 / Completed October 14 2026 UTC

Revy tested six rounds with four independently responding fictional personas. Structured follow-ups exposed a real priority split and a shared safeguard. The app report intentionally exports selected ideas and anonymous aggregate results. This companion preserves the complete authorized fictional trail for reviewing the meeting outcome.

What the test established

Meeting outcome: All four personas support conditional, staged preparation. Nobody approved expansion to 40 technicians in three weeks. Trial size, duration, numerical reliability threshold and launch date were not agreed.

Useful interaction: Four comments and a host note were preserved correctly. Ideas, Choose and Rate each received four replies. Choose split 3 to 1; unanimous ratings did not resolve that disagreement.

Highest priority defect: The first structured ask required participant reloads, followed by misleading missing-response messages. Present task visibility, skipped asks and unsupported AI synthesis also need attention.

Evidence boundary: This was mediated testing through separate browser views on George's Mac, not observation of independent human users or physical field devices.

Fictional scenario

Harborlight Field Services is piloting Relay with 12 technicians and three dispatchers. Assignment time fell from 90 to 38 minutes, short of a 30-minute goal. Two offline-sync duplicate assignments occurred; one urgent job was dispatched by phone. Seven technicians use Relay daily and five keep paper notes. Leadership wants 40 technicians in three weeks without additional headcount. Four engineers, one designer and one QA balance reliability, an aging CRM, training and delivery promises.

These are supplied fictional test facts, not measured app performance. The host entered a 918-character Workie briefing and confirmed it was on. AI reused the duplicate assignments, phone rescue and timing context. Participants were told Workie had a host briefing; raw briefing text was not exposed, but derived facts were reused publicly.

Correction after source review

October 14, 2026, 02:32 UTC: Phase D explicitly specifies picked ideas only and no names. The observed report selection and anonymity follow that design; they do not establish accidental data loss or report corruption. The earlier high-severity report finding is withdrawn. An archive of all ideas without names would be an optional scope change. Sources and details are on page 6.

This is the companion review. The separate app-generated report was verified as a 17-page PDF on George's Mac; its transfer into this conversation did not complete.

Test coverage and scores

Host Revy and participants Maya Chen (product), Theo Brooks (engineering), Lena Ortiz (training and user advocate) and Omar Patel (operations) used five named Chrome views plus a separate Present window. Four independent agents supplied the actual answers, rankings and follow-up replies. Identity was checked before each action.

Six substantive rounds produced 24 answers, 24 ballots and six advisor analyses. All four responses and ballots were verified before each round closed. Detailed Vote full cards were inspected each round; independent selections were entered through Quick Vote. Anonymous numbering changed each round. The voting UI says it hides names, not identities. Rejoin/reload during the first ask preserved scores and later submissions.

Round and lesson	Maya	Theo	Lena	Omar
1 Churchill Bets Britain on an Unproven Ally	2	9	4	9
2 Meiji Emperor Dismantles a Thousand Years of Tradition	3	10	6	5
3 Fleming Notices What Everyone Else Discards	4	9	3	8
4 Boudicca Leads a Revolt with No Retreat Plan	8	5	2	9
5 Ada Lovelace Programs a Machine Not Yet Built	7	8	3	6
6 Ashoka Abandons Conquest After Kalinga	4	11	2	7
Total	28	52	20	44

24 points per round; 144 points overall. Queue and results were verified in the UI and generated report. Scores are voting outcomes, not adoption of a proposal.

Actual team tasks

1. Which current bets look a long shot externally; what must stay true to hold course, what signal makes us fold?

2. Which long-standing process/structure must be dismantled, who benefits, how bring them with us?

3. Which anomaly are we explaining away, how treat next as lead, who has time?

4. Where is waiting for information the larger risk, what smallest move preserves option?

5. What future capability should we design for, what assumptions, how test cheaply?

6. Which recent win is warning, what enables changing course after success?

Task wording was present on host and participant answering views, absent from Present answering/voting and the generated report. The participant voting view also omitted the task.

Present and follow up usability

Discovery and separate room display

Default lobby and Session Settings did not expose Present. A research-assisted manual surfaces=two opt-in revealed the PRESENT link and Said in the room field in the same room. Revy supplied that clue to the test operator; George did not explicitly supply the URL. This separates opt-in functionality from default discoverability.

The ordinary PRESENT link opened a separate window. Present removed host controls and tracked answering, voting, results and asks. It showed host-selected Response 3 correctly, with a readable main response and other-response snippets; names were hidden during voting and revealed after close. Feedback Present initially showed only a title and instruction, not the incoming comment wall. Ideas initially showed zero selected ideas; choosing one displayed only that idea.

Displays settings listed only Built-in Display, so actual second-monitor operation was not tested. No display settings were changed. Lobby and Present screenshots were inspected inline; no persistent browser screenshot file was created.

Structured asks and skip friction

Classic round 1 had six AI pages and no ask tags, only Request feedback at the end. After opt-in, round 2 showed asks beside Discussion topics and next steps, plus a “3 asks ready” cue. Preview offered Ideas, Choose, Rate, the participant prompt, purpose, Edit, Cancel and Send to room. All three ask types were sent sequentially and each received four of four replies. Later Choose and Rate arrived without reloads.

Choose option B was visibly incomplete: “unowned parallel dispatch records, where Relay, spreadsheets and paper”. Options A and B also overlapped conceptually. Next round was available on every AI page, including page 1 with asks ready. Round 3 advanced from page 3 with two asks ready, with no confirmation or explicit skip label. Round 6 ended with three asks ready, one Choose chip, Request feedback and Next round, but no unified Ask the room step. The arrow hint says the end starts the next round.

Priority findings and recommended fixes

By design - report selection and anonymity: Ideas exports the host-selected text; Choose and Rate export anonymous aggregates. This matches Phase D, not a demonstrated defect. An optional archive of all ideas could retain anonymity and shown status. Author attribution is a separate privacy decision, not a default recommendation.

High - first ask and rejoin state: Existing participants remained on Results while host and Present showed an ask at 0/4. Reloading the same named views delivered it. Later Results claimed “You didn’t send a response this round” despite recorded points and the original response in the report. This confirms a misleading receipt/rejoin state, not database answer loss. A classic-to-opt-in transition is a plausible trigger; a general fresh-room defect was not established.

Medium - orientation and comparison: Present omitted the actual task. Quick Vote truncated the similar openings of round 1 alternatives so they were hard to distinguish; Detailed Vote’s full cards helped. Keep the task visible and make full proposals easy to compare.

Medium - discoverability and skipped asks: Add an explicit Ask the room checkpoint and intentional “Skip asks and continue”; reserve primary Next for reading progression. Clarify Request feedback versus Ideas, Choose and Rate.

Attributed comments and host note

Round 1 Request feedback used the generic prompt “What do you make of it?” and offered AI summary, results and individual-response targets. All four comments below and the host room note were verified in the generated report with correct comment authors and targets.

Maya on AI

The proposals can fit together, but compatibility doesn’t establish agreement on timing or thresholds. I don’t accept expansion to 40 now. I support preparing a smaller next stage while engineering proves offline ownership and operations defines stop authority. Frontline interviews should shape that stage, not become a parallel task whose findings arrive after launch.

Theo on Omar response

I support Omar’s named stop authority and evidence-based restart. I do not accept expansion to 40 now. Operations and engineering should agree the gate together: verified duplicate prevention, a tested urgent-job fallback, and a small field trial. I can own replay-test evidence; I cannot promise a reliable fix within 3 weeks before we understand the sync failure.

Lena on results

The votes support clear stop authority and reliability evidence, which I accept as necessary gates. They do not establish that technicians are ready for expansion. I support interviewing the five paper users before committing to 40; training should address their actual obstacles, and we should check understanding and daily use rather than attendance alone.

Omar on AI

I support staged enrollment, not expansion to all 40 now. The summary captures compatible safeguards, but compatibility is not approval: we still need a named stop authority, a tested urgent-job fallback, and evidence that offline reconciliation prevents duplicates. Interviews with the five paper users should inform the rollout plan, not become a reason to postpone those safety gates.

Revy host note in Said in the room

“Revy host: No approval to expand to all 40 today. Proposed staged preparation remains conditional on offline proof, emergency fallback and paper-user interviews; no launch date or numerical reliability threshold has been agreed.”

The report preserved this full note under Said in the room. “Revy host” is attribution typed into the note, not separately captured author identity.

What the trail changes

Compatible safeguards did not amount to expansion approval. Engineering’s proposed evidence ownership was qualified; the three-week reliability commitment was explicitly rejected. The frontline interviews were intended to shape the next stage, and urgent-job fallback and named stop authority remained required safeguards.

All twelve structured replies

Ideas from round 2 Discussion topics point 3

Prompt: What is one measurable gate Relay should pass before more technicians are added?

Maximum 280 characters. Three personas shortened their own initially longer replies before submission. Four of four ideas were received; Revy selected Maya's idea for display.

Maya: In a limited next-stage trial, every assignment must have one traceable owner through offline recovery, with zero duplicates. Publish the trial size and duration before starting; passing a tiny or unusually clean test must not authorize all 40 technicians.

Theo: Gate expansion on a field trial covering offline assignment, reconnect and emergency phone fallback: zero duplicate job ownership, every urgent job reconciled to one named owner, and recorded test cases and failures. Faster averages cannot replace this evidence.

Lena: Each of the five paper users completes three representative jobs, including offline updates and a fallback handoff, without lost essential information or unexplained workarounds. Record obstacles and check they know who owns each assignment.

Omar: Require five operating days with zero duplicate assignments across Relay, phone and paper, plus an observed offline-recovery drill. Log exceptions daily; a named operations lead must confirm urgent-job coverage before enrollment grows.

Generated HTML exported Maya's selected text without a name, showing "4 ideas · 1 shown". The other three ideas are outside its designed scope; all four appear here.

Choose from round 2 Suggested next steps point 1

Prompt: Which should be retired first?

A: informal job ownership across Relay, paper and phone.
B: unowned parallel dispatch records, where Relay, spreadsheets and paper.
C: the commitment process that treats the launch date and technician count as fixed.

Maya: C. Theo: A. Lena: A. Omar: A.
Result: A 3, B 0, C 1. The report preserved the exact prompt, options and counts. Individual choice authors are excluded by design.

Option B is reproduced as shown, including its incomplete wording. In separately supplied explanations, Maya prioritized changing commitments so deadlines could not override safeguards; the other three prioritized ownership clarity while preserving fallback. The UI did not request those reasons, and they were not submitted as choices.

Rate from round 2 Discussion topics point 2

Prompt: Retire a workaround only when Relay reliably provides its protection.

Scale: 1 Disagree to 5 Agree.
Maya: 5. Theo: 5. Lena: 5. Omar: 5.
Mean 5.0; histogram: four at 5 and zero at every other rating. The report's aggregate was correct and anonymous by design.

Separately supplied reasons emphasized equivalent protection, degraded-condition tests, ownership and reconciliation. The UI did not request or receive them. Unanimity on the principle did not resolve the Choose disagreement.

AI findings and verification limits

AI synthesis improved but still overclaimed

Round 1 correctly recorded the 9-9 tie and compatible proposals. Named tallies in rounds 2, 5 and 6 matched the report. Analyses were shorter at six to eight pages versus the prior nine to eleven. Suggested next steps were labeled as suggestions, proposed role owners were sometimes qualified, and scenario context was used concretely.

Round 4 still manufactured an unsupported opposition: “The choice is whether to act on rules before the evidence is in, or to hold until it is.” Theo had actually written “We should not wait for a complete root cause before protecting investigation capacity” and “Freeze new expansion commitments today”, while retaining phone fallback. Omar’s temporary rule today and Theo’s investigation today were compatible.

Round 3 said “Two answers” investigated paper, but Maya, Lena and Omar all did. Round 1 claimed an answer was the “only answer naming five paper users”, overlooking Maya’s “Learn why five technicians keep paper”. These are synthesis/count overclaims, not named score errors.

The report also omitted original team tasks. Source-set About included Negotiation despite its exclusion, describing the source catalog rather than the active selection.

Retained listing and exported file

Your reports listed Relay expansion - Call and Answer review, session 7924, kept until January 11, 2027. Original session 6497 was still listed, kept until January 9, 2027. This confirms listing and persistence only. A retained HTML snapshot was not independently reopened. The retained-report PDF download timed out/reset; that attempt’s outcome must be checked before retrying.

A separately printed local app report was verified at 17 pages and 697,111 bytes. Parsed and normalized text verified the title, session code, all six lesson headings, Choose prompt, “4 ideas” count and host note. That count describes submissions; only the selected idea text is exported. This designed scope was already visible in generated HTML before printing, so it is not a PDF-only behavior.

Original PDF SHA-256:
18a400dee1ea4ec94a6f6aeecf209ecf356cf4a93d7acdb8029e6e767e9790f8

The app report remains on George’s Mac at Documents/Codex/2026-10-11/task/Relay-expansion-session-7924.pdf. Its attachment transfer failed before a Library file was created. This companion is a separate review document.

Source review correction on October 14 2026

At 02:32 UTC, source review confirmed Phase D says “picked ideas only” and “No name anywhere in the section”. Implementation dd682bac exports picked text and aggregate results; its test explicitly expects “4 ideas · 1 shown”. The earlier high-severity report classification is withdrawn. These are deliberate scope and privacy choices, not demonstrated accidental data loss or corruption. An optional anonymous archive of all submitted ideas is distinct from any decision about author attribution.

Host and participant reviews

These full reviews are historical reflections from mediated UI testing. The four persona reviews predate report verification; all five reviews predate the source correction on October 14, 2026. Revy’s report criticism below is preserved as an earlier assessment, not the current defect classification. Source review confirms selection and anonymity are by design; see page 6. “Pending” reporting statements describe knowledge at collection time.

Revy host review

The separate room screen is useful: I can choose a response or idea without exposing the host controls, and the preview explains what participants will see before I send an ask. Structured asks produced a real 3-1 priority split and shared principle, rather than automatic agreement. Said in the room let me preserve the crucial distinction between conditional preparation and expansion approval. Targeted comments were easier to relate to the source than generic discussion notes.

I would struggle to discover this default test workflow without manual URL knowledge. Next round can erase the opportunity to ask before I have read the final pages, and Request feedback doesn't explain how it differs from Ideas/Choose/Rate. The first ask stalled participants until reload; the later missing-response message would make me question whether anyone's answer had vanished.

Present's missing task means I'd have to read the question aloud. Report omission of unshown ideas and authors is especially serious: the meeting record should not depend on which idea I happened to project. AI is more cautious in places but still manufactures an act-versus-wait tradeoff. I would use this with explicit facilitation and a complete companion log, not treat scores or AI as adopted decisions.

Maya Chen product

The six rounds helped me distinguish a useful expansion objective from an unsafe promise. Independent rankings surfaced engineering gates, operational authority and frontline investigation without requiring everyone to endorse my proposal. Ideas, Choose and Rate gave us different ways to expose our positions. The Choose result mattered: I chose the commitment process while three others chose assignment ownership. Our shared rating of five supports protecting workarounds, but does not resolve that difference.

Discoverability needs work. Present and follow-up controls appeared only after a manual setting change. Present removed host controls, which suits a room screen, but omitted the actual task. Quick choices truncated the evidence; full Detailed cards supported fairer comparison. The first follow-up required participant reloads, then misleadingly claimed no response had been sent despite an existing score. That weakens confidence in participation records. Full-summary feedback and targeted comments helped me challenge AI’s compatibility claim.

My position remains conditional: prepare a smaller stage, renegotiate the promise now, and require credible reliability and adoption evidence. I have not agreed to 40 technicians in three weeks. Report fidelity remains unverified.

Participant reviews continued

Historical reviews preserved in full from before report verification and source review. The October 14 correction on page 6 confirms reporting selection and anonymity are by design.

Theo Brooks engineering

Six rounds helped distinguish useful speed gains from evidence of safe expansion. Independent answers and rankings surfaced ownership rules, recovery tests, dispatcher capacity and frontline workarounds. The Ideas, Choose and Rate follow-ups made agreement more specific: unanimous support for preserving workaround protections did not erase the split over which process to retire first.

Discovery was weak. Present and follow-ups appeared only after changing surfaces to two. Present separated room content from host controls, but omitting the actual task during answering undermined orientation. Truncated Quick Vote choices made technical proposals hard to compare; Detailed Vote’s full cards helped.

The first follow-up required a participant reload, which then misleadingly said I had not sent a response despite a recorded score. That weakens confidence in receipts and attribution. Report inclusion is still pending verification. My review reflects relayed UI evidence and mediated browser views, not physical-device testing.

Consensus position: I support a gated, staged expansion with named stop authority and protected investigation capacity. I do not approve 40 technicians in three weeks without verified offline ownership, emergency reconciliation and field-trial evidence.

Lena Ortiz training and user advocate

The six rounds helped me connect frontline habits with engineering and operations decisions. Paper use became something to investigate, rather than a training failure to assume. I support conditional expansion: understand the five paper users’ needs, test offline and urgent handoffs, and retain clear fallback ownership. I do not support an unconditional move to 40 technicians in three weeks.

The follow-ups made useful distinctions visible. Our choice was split, while everyone agreed that a workaround should remain until its protection is reliably replaced. Agreement on that principle does not establish readiness or settle which process to retire first.

The mediated UI evidence shows avoidable friction. Present omitted the task while people were answering; Quick Vote truncated alternatives, although Detailed Vote offered full cards. The first follow-up required participant reload, and the resulting “you didn’t send a response” message contradicted the recorded score, undermining submission confidence. Hidden Present and ask controls also burdened discovery. Report inclusion is still pending verification. These observations concern separate browser views, not physical field devices.

Operations review and test scope

Omar’s historical review predates report verification and source review. See the October 14 correction on page 6. The scope details below record subsequent checks.

Omar Patel operations

The six rounds helped me connect expansion promises with emergency continuity, assignment ownership and adoption. Independent votes made the priorities visible, but did not establish consensus. I support a staged expansion only after clear stop authority, tested urgent-job fallback, reliable offline reconciliation and manageable dispatcher workload. I do not approve enrolling all 40 technicians in three weeks yet. The choice split of three A and one C should remain visible; unanimous ratings on protecting workarounds do not resolve that disagreement.

Discoverability was the largest friction: Present and follow-up asks appeared only after manually switching to two surfaces. Present separated room content from host controls, but omitted the actual task while answering. Quick Vote truncated proposals; Detailed Vote offered a fairer comparison.

The first ask required a participant reload, followed by a misleading “you didn’t send response” message despite a recorded score. That weakens confidence in participation records. Feedback targets and the host room note were useful. Report inclusion remains pending verification. This was mediated separate-view testing, not physical-device testing.

Catalog and queue changes

Catalog: Historic World Leaders advice and guidence (Imported 2026-08-17), 50 questions. Negotiation’s 12 questions were excluded at creation, leaving 38 eligible. Moving Meiji earlier changed the autoqueue Churchill, Fleming, Meiji, Boudicca, Ada, Ashoka to Churchill, Meiji, Fleming, Boudicca, Ada, Ashoka; one move promoted all six preview entries to explicit queue picks. During Fleming, disabling the 11 remaining New territory questions reduced eligibility from 35 to 24 without changing the live question. Queued Ada later ran as a category override.

Scope and provenance

App Save 90 days was submitted. The room was left at six rounds and was not advanced to seven. Original 6497 still showed four players and six rounds. Build Rooms 6455/6521, the shared catalog, admin invite and other work were untouched. No developer switch, deployment, source change, installation or paid upgrade occurred. Served asset: /static/js/main.42283f4e.js, with /config.js and /tier-favicon.js; no semantic release or commit was verified.

Not tested: physical mobile devices, real field users, a second monitor, network-fault injection, large groups, accessibility, privacy/security, other export formats, ask edit/cancel, platform flag configuration or document-upload briefing. The briefing was typed. The app displayed local October 13; completion was October 14, 2026 UTC.
